1.
Consider the toy key exchange protocol using an online trusted 3rd party (TTP) discussed in Lecture 9.1. Suppose Alice, Bob, and Carol are three users of this system (among many others) and each have a secret key with the TTP denoted k_a, k_b, k_c respectively. They wish to generate a group session key k_{ABC} that will be known to Alice, Bob, and Carol but unknown to an eavesdropper. How would you modify the protocol in the lecture to accommodate a group key exchange of this type? (note that all these protocols are insecure against active attacks)

- Alice contacts the TTP. TTP generates random k_{ABC} and sends to Alice

  $$E(k_a, k_{ABC}), \quad \text{ticket}_1 \leftarrow E(k_b, k_{ABC}), \quad \text{ticket}_2 \leftarrow E(k_c, k_{ABC}).$$

  Alice sends ticket_1 to Bob and ticket_2 to Carol.

Correct
The protocol works because it lets Alice, Bob, and Carol obtain k_{ABC} but an eaesdropper only sees encryptions of k_{ABC} under keys he does not have.

- Alice contacts the TTP. TTP generates a random k_{ABC} and sends to Alice

  $$E(k_a, k_{ABC}), \quad \text{ticket}_1 \leftarrow k_{ABC}, \quad \text{ticket}_2 \leftarrow k_{ABC}.$$

  Alice sends ticket_1 to Bob and ticket_2 to Carol.

Bob contacts the TTP. TTP generates a random k_{AB} and a random k_{BC}. It sends to Bob

2.
Let G be a finite cyclic group (e.g. $G = \mathbb{Z}_p^*$) with generator g.

Suppose the Diffie-Hellman function $\mathrm{DH}_g(g^x, g^y) = g^{xy}$ is difficult to compute in G. Which of the following functions is also difficult to compute?

As usual, identify the f below for which the contra-positive holds: if $f(\cdot,\cdot)$ is easy to compute then so is $\mathrm{DH}_g(\cdot,\cdot)$. If you can show that then it will follow that if DH_g is hard to compute in G then so must be f.

- [ ] $f(g^x, g^y) = (g^{3xy}, g^{2xy})$ (this function outputs a pair of elements in G)

Correct
an algorithm for calculating $f(\cdot,\cdot)$ can

easily be converted into an algorithm for

calculating $\mathrm{DH}(\cdot,\cdot)$.

Therefore, if f were easy to compute then so would DH,

contrading the assumption.

- [ ] $f(g^x, g^y) = g^{x-y}$

Un-selected is correct

- [ ] $f(g^x, g^y) = g^{x(y+1)}$

Correct
an algorithm for calculating $f(g^x, g^y)$ can

easily be converted into an algorithm for calculating $\mathrm{DH}(\cdot,\cdot)$.

3.
Suppose we modify the Diffie-Hellman protocol so that Alice operates

as usual, namely chooses a random a in $\{1,\ldots,p-1\}$ and

sends to Bob $A \leftarrow g^a$. Bob, however, chooses a random b

in $\{1,\ldots,p-1\}$ and sends to Alice $B \leftarrow g^{1/b}$. What

shared secret can they generate and how would they do it?

- (●) $\text{secret} = g^{a/b}$. Alice computes the secret as B^a

  and Bob computes $A^{1/b}$.

Correct
This is correct since it is not difficult to see that

both will obtain $g^{a/b}$

- ( ) $\text{secret} = g^{b/a}$. Alice computes the secret as B^a

  and Bob computes $A^{1/b}$.

- ( ) $\text{secret} = g^{a/b}$. Alice computes the secret as $B^{1/a}$

  and Bob computes A^b.

- ( ) $\text{secret} = g^{a/b}$. Alice computes the secret as $B^{1/b}$

  and Bob computes A^a.

4.
Consider the toy key exchange protocol using public key encryption described in Lecture 9.4.

Suppose that when sending his reply $c \leftarrow E(pk, x)$ to Alice, Bob appends a MAC $t := S(x, c)$ to the ciphertext so that what is sent to Alice is the pair (c, t). Alice verifies the tag t and rejects the message from Bob if the tag does not verify.

Will this additional step prevent the man in the middle attack described in the lecture?

- it depends on what public key encryption system is used.
- it depends on what MAC system is used.

This should not be selected
No, the attack is still possible, no matter what MAC is used.

An active attacker can decrypt $E(pk', x)$ to recover x

and then replace (c, t) by (c', t')

where $c' \leftarrow E(pk, x)$ and $t \leftarrow S(x, c')$.

- no
- yes

5.
The numbers 7 and 23 are relatively prime and therefore there must exist integers a and b such that $7a + 23b = 1$.

Find such a pair of integers (a, b) with the smallest possible $a > 0$.

Given this pair, can you determine the inverse of 7 in $\mathbb{Z}_{23}$?

Enter below comma separated values for a, b, and for 7^{-1} in $\mathbb{Z}_{23}$.

10, -3, 10

정답
$7 \times 10 + 23 \times (-3) = 1.$

Therefore $7 \times 10 = 1$ in $\mathbb{Z}_{23}$ implying

Week 5 - Problem Set

테스트, 15개의 질문 that $7^{-1} = 10$ in $\mathbb{Z}_{23}$.

9.
While we are at it, how much is $2^{245} \mod 35$?

Hint: use Euler's theorem (you should not need a calculator)

32

정답
By Euler $2^{24} = 1$ in $\mathbb{Z}_{35}$ and therefore

$1 = 2^{24} = 2^{48} = 2^{72}$ in $\mathbb{Z}_{35}$.

Then $2^{245} = 2^{245 \bmod 24} = 2^5 = 32$ in $\mathbb{Z}_{35}$.

15.

If p is a prime, how many generators are there in $\mathbb{Z}_p^*$?

- $(p+1)/2$
- $\varphi(p)$
- $(p-1)/2$
- $\varphi(p-1)$

Correct

The answer is $\varphi(p-1)$. Here is why. Let g be some generator of $\mathbb{Z}_p^*$ and let $h = g^x$ for some x.

Week 5 - Problem Set

테스트, 15개의 질문 **12/15점(80%%)**

It is not difficult to see that h is a generator exactly when we can write g as $g = h^y$ for some integer y (h is a generator because if $g = h^y$ then any power of g can also be written as a power of h).

Since $y = x^{-1} \bmod p - 1$ this y exists exactly when x is relatively prime to $p - 1$. The number of such x is the size of $\mathbb{Z}_{p-1}^*$ which is precisely $\varphi(p - 1)$.
